Hybrid Authorship and Digital Provenance

How the Anonymo AI Framework solves the identity problem for AI-assisted assets

Chris Montgomery · ORCID: 0009-0009-5364-249X · DOI: 10.5281/zenodo.19193152 · © 2025–2026

AI has entered the creative workflow — and the industry still doesn't know how to handle it

[01] By 2026, the majority of professional creative workflows already involve some level of AI assistance — whether in image generation, text, code, or diagrams.

[02] The problem: legal and technical authorship frameworks were built for a **binary world** — content is either human-made or it is not.

[03] Companies like Adobe, Getty Images, and Google are only now beginning to build "content credentials" systems — the market is forming right now.

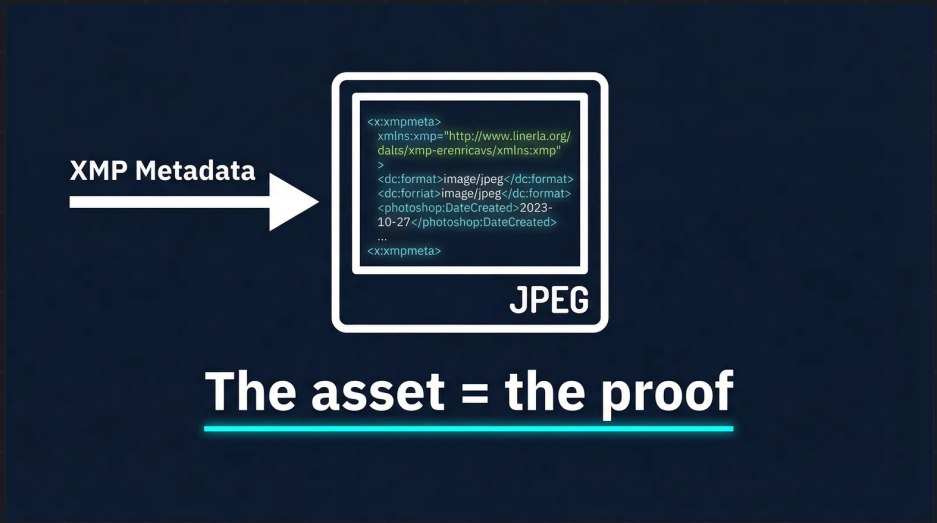
[04] Those who define the standards now will lead the conversation tomorrow.

** Note: Emerging movements like the C2PA (Coalition for Content Provenance and Authenticity) seek to standardize these credentials.*

”Made by human with AI” is not recognized as a category — yet

- Claiming pure human authorship is inaccurate when AI tools participated in the process.
- Attributing the work to AI ignores the intellectual property, creative direction, and conceptual framework of the human author.
- Result: invisibility of the human contribution, legal risk, and absence of traceability.
- The technical challenge: creating a standardized, machine-readable, and tamper-evident method to declare this hybrid relationship.

XMP turns every image into its own proof of existence

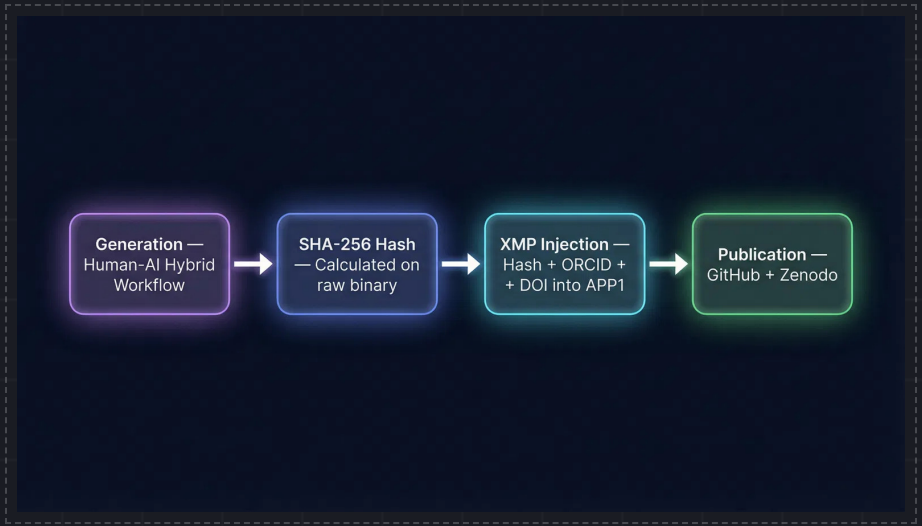


- **XMP (Extensible Metadata Platform, ISO 16684-1)** is an Adobe standard that allows embedding RDF/XML metadata directly into the binary of JPEG, PNG, and TIFF images.
- Unlike external JSON files or detached documentation, XMP travels with the file — the image carries its own identity.
- Supports **custom namespaces**, enabling specific fields to declare hybrid workflows.
- Natively read by Adobe Bridge, Lightroom, ExifTool, and any ISO-compliant software.

The custom `anonymo:` namespace declares every dimension of hybrid authorship

Field	Value	Meaning
anonymo:OriginalAuthorship	Human	Intellectual property is human
anonymo:CreationType	Human-AI Hybrid	Nature of the workflow
anonymo:IntellectualFramework	TCF/TFB	Governing conceptual framework
anonymo:IntegrityHash	SHA-256	Cryptographic proof of visual content
anonymo:RecordLink	Zenodo DOI	Immutable public record
anonymo:ORCID	0009-0009-5364-249X	Unique author identifier

The hash is calculated before injection — ensuring real integrity



[01]

Generation

The visual asset is created through the human-AI hybrid workflow.

[02]

SHA-256 Hash

Calculated on the raw image binary *before* any metadata is injected — the hash represents the pure visual content.

[03]

XMP Injection

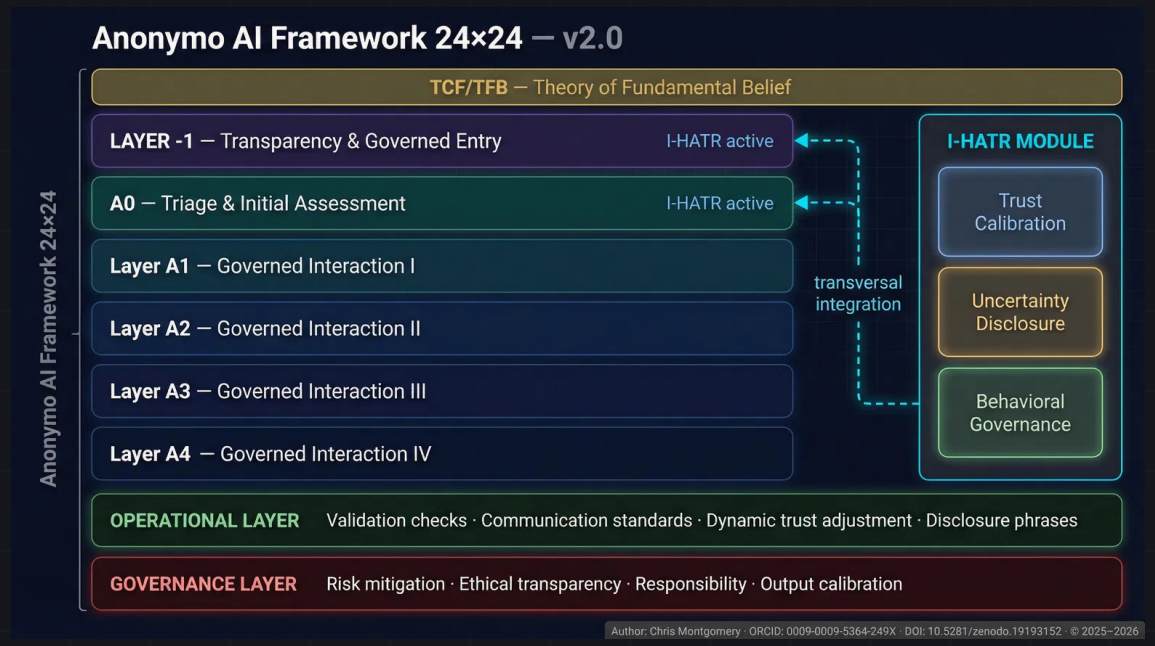
The XMP block containing the hash, ORCID, and DOI is injected into the image's APP1 marker.

[04]

Publication

The asset goes to GitHub (public timestamp) and/or Zenodo (immutable DOI) — verifiable by anyone.

The framework architecture already incorporates the I-HATR trust calibration layer



- The **Anonymo AI Framework 24×24 v2.0** is structured in governed layers: Layer -1 (transparent entry), A0 (triage), A1–A4 (governed interaction).
- The **I-HATR** module operates transversally across layers -1 and A0, contributing: trust calibration, uncertainty disclosure, and behavioral governance.
- The **Operational Layer** defines communication standards and dynamic trust adjustment.
- The **Governance Layer** ensures ethical transparency and alignment with real system reliability.

The market is moving — and this work is already documented and published

[+] The C2PA (Coalition for Content Provenance and Authenticity), formed by Adobe, Microsoft, Google, and the BBC, is formalizing content credentials at scale — but still in early adoption stages.

[+] The Anonymo AI Framework already has: custom XMP namespace, functional injection script, public repository with timestamp, academic DOI on Zenodo, and bilingual documentation.

[+] Public proof of existence: GitHub commit + DOI = immutable record of prior art.

[+] Those who document first, define the standard.

Hybrid authorship is the present — verifiable provenance is the future

The methodology developed in the Anonymo AI Framework solves today a problem the industry is still trying to formulate. Every asset generated under this framework carries its own identity: who created it, how it was created, under which theory, with which cryptographic hash, and with a link to a public record.
