Asset Package Comparison Report: v1 vs v2

Author: Chris Montgomery (Anonymo AI Framework)
Date: March 23, 2026
Framework: TCF/TFB (Trust Calibration Framework / Trust Feedback Behavior)

---

1. Overview

This report details the differences between the original asset package (`anonymo_asset_package_v1.zip`) and the newly generated package (`anonymo_asset_package_v2.zip`). The primary distinction lies in the inclusion of high-resolution visual assets that have been cryptographically sealed with XMP provenance metadata, demonstrating the practical application of the Anonymo AI Framework's hybrid authorship methodology.

2. Package Comparison

The table below summarizes the structural and content differences between the two versions.

Feature	`anonymo_asset_package_v1.zip`	`anonymo_asset_package_v2.zip`
Total Size	~4.8 KB	~3.6 MB
Purpose	Base templates and documentation	Complete methodology demonstration
Visual Assets	None (Placeholder only)	5 High-resolution images
XMP Metadata	Template XML only	Embedded directly in image binaries
Cryptographic Proof	Text checksums	SHA-256 hashes injected via XMP

3. Detailed Content Analysis

3.1. Original Package (v1)

The original package served as the foundational structure for the provenance methodology. It contained the necessary templates and documentation but lacked the actual visual assets demonstrating the implementation.

Contents:

- `README.md` / `README.txt`: Core documentation.
- `metadata.json` / `manifest.json`: Structural metadata definitions.
- `TEMPLATE_XMP.xml`: The raw XML template for the `anonymo:` namespace.
- `checksum.txt`: Basic integrity checks.
- `ASSET_FILES_HERE.txt`: A placeholder indicating where visual assets should be placed.

3.2. New Package (v2)

The updated package represents the fully realized methodology. It includes the core structural files from v1 (metadata, manifest, XMP template) alongside five high-resolution images generated for the framework's documentation and presentation.

Crucially, each of these images has been processed through the 4-step cryptographic integrity workflow.

Included Visual Assets (with embedded XMP):

1. **`anonymo_framework_24x24_xmp.jpg`** (988 KB)
    - *Description:* The complete architectural diagram of the Anonymo AI Framework 24x24 v2.0.
    - *Pre-injection SHA-256:* `d60deaf817cb837194fba269d3ad6e3fd18c2b5eeaaae918810d3b7332382cbd`
2. **`slide_img_spectrum_xmp.jpg`** (688 KB)
    - *Description:* Diagram illustrating the spectrum from 100% Human to 100% AI authorship.
    - *Pre-injection SHA-256:* `90403058a9110f9d5775e8fc7f1eba13407964d921dc196501880fe9cd4bc1ef`
3. **`slide_img_xmp_xmp.jpg`** (692 KB)
    - *Description:* Illustration of XMP metadata being embedded into a JPEG image binary.
    - *Pre-injection SHA-256:* `46981f207d411d86fc8bd7f32d33b7a2555a787c3571a6ba802ef2f132d15800`
4. **`slide_img_workflow_xmp.jpg`** (664 KB)
    - *Description:* Flowchart depicting the 4-step cryptographic integrity workflow.
    - *Pre-injection SHA-256:* `8138605b18a30fd64654cf8383d2aadebaef299a57a6bff55cf2c7c0cdec312c`
5. **`slide_img_timeline_xmp.jpg`** (672 KB)
    - *Description:* Timeline showing the emergence of C2PA and the Anonymo AI Framework.
    - *Pre-injection SHA-256:* `23b757167528383b477da9bb6ac58c6613620e6d950a31ec9f617681139c5afa`

4. Significance of the Update

The transition from v1 to v2 is not merely an addition of files; it is the transition from theory to practice.

In v1, the `TEMPLATE_XMP.xml` demonstrated *how* the metadata should be structured. In v2, the five `.jpg` files demonstrate the metadata *in action*. By extracting the XMP block from any of these images, one can verify the `anonymo:IntegrityHash` against the visual binary, confirming the asset's provenance, the human author's ORCID, and the immutable Zenodo DOI record.

This package serves as a self-contained, verifiable artifact of the Anonymo AI Framework's capabilities in establishing digital provenance for hybrid authorship.
